

Experian Infrastructure PoC

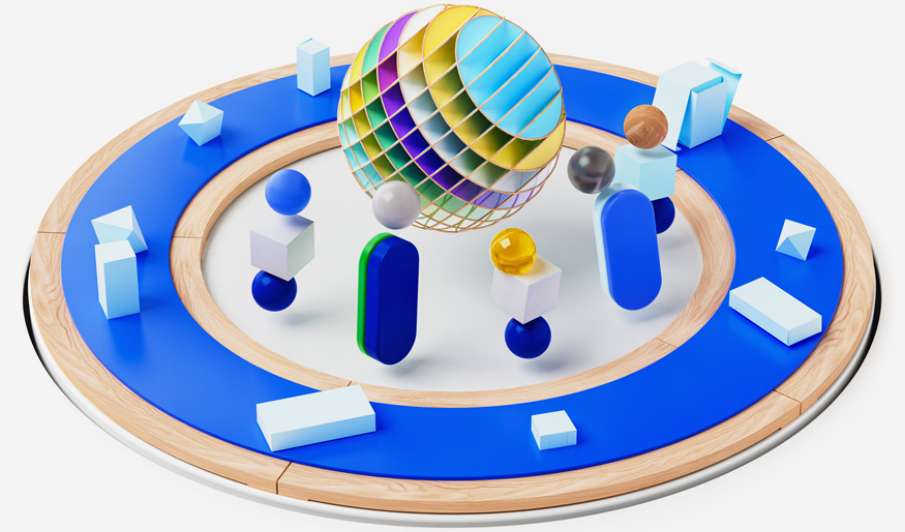

Golden Workflow: From Developer Commit to Governed Cloud Provisioning

May 2026

IBM Client Engineering Proving value through outcome driven solutions

Overview

How might we design a fully self-service experience that accelerates developer velocity without compromising governance?

Project Scope

- *Fully functional end-to-end Golden Workflow*
- *Validates the Enterprise DevOps platform integration with Experian's golden workflow (Cloud Provisioning, Infrastructure Standardization, Security Governance, and Day-2 operations)*
- *Integrates: Terraform Cloud, Vault, Sentinel, HCP Packer, Ansible Automation Platform (AAP), Harness, Cloudability*

Overview

The Goal

Prove that developer velocity and governance are not a trade-off. You can have both, in a fully self-service model.

What Success Looks Like

- Developer provisions a resource via GitHub
- Sentinel blocks a non-compliant change
- Vault issues short-lived credentials
- Cost estimate appears before deployment
- Drift is detected automatically

Overview

Devin Davis

Software Developer,
4 years in role

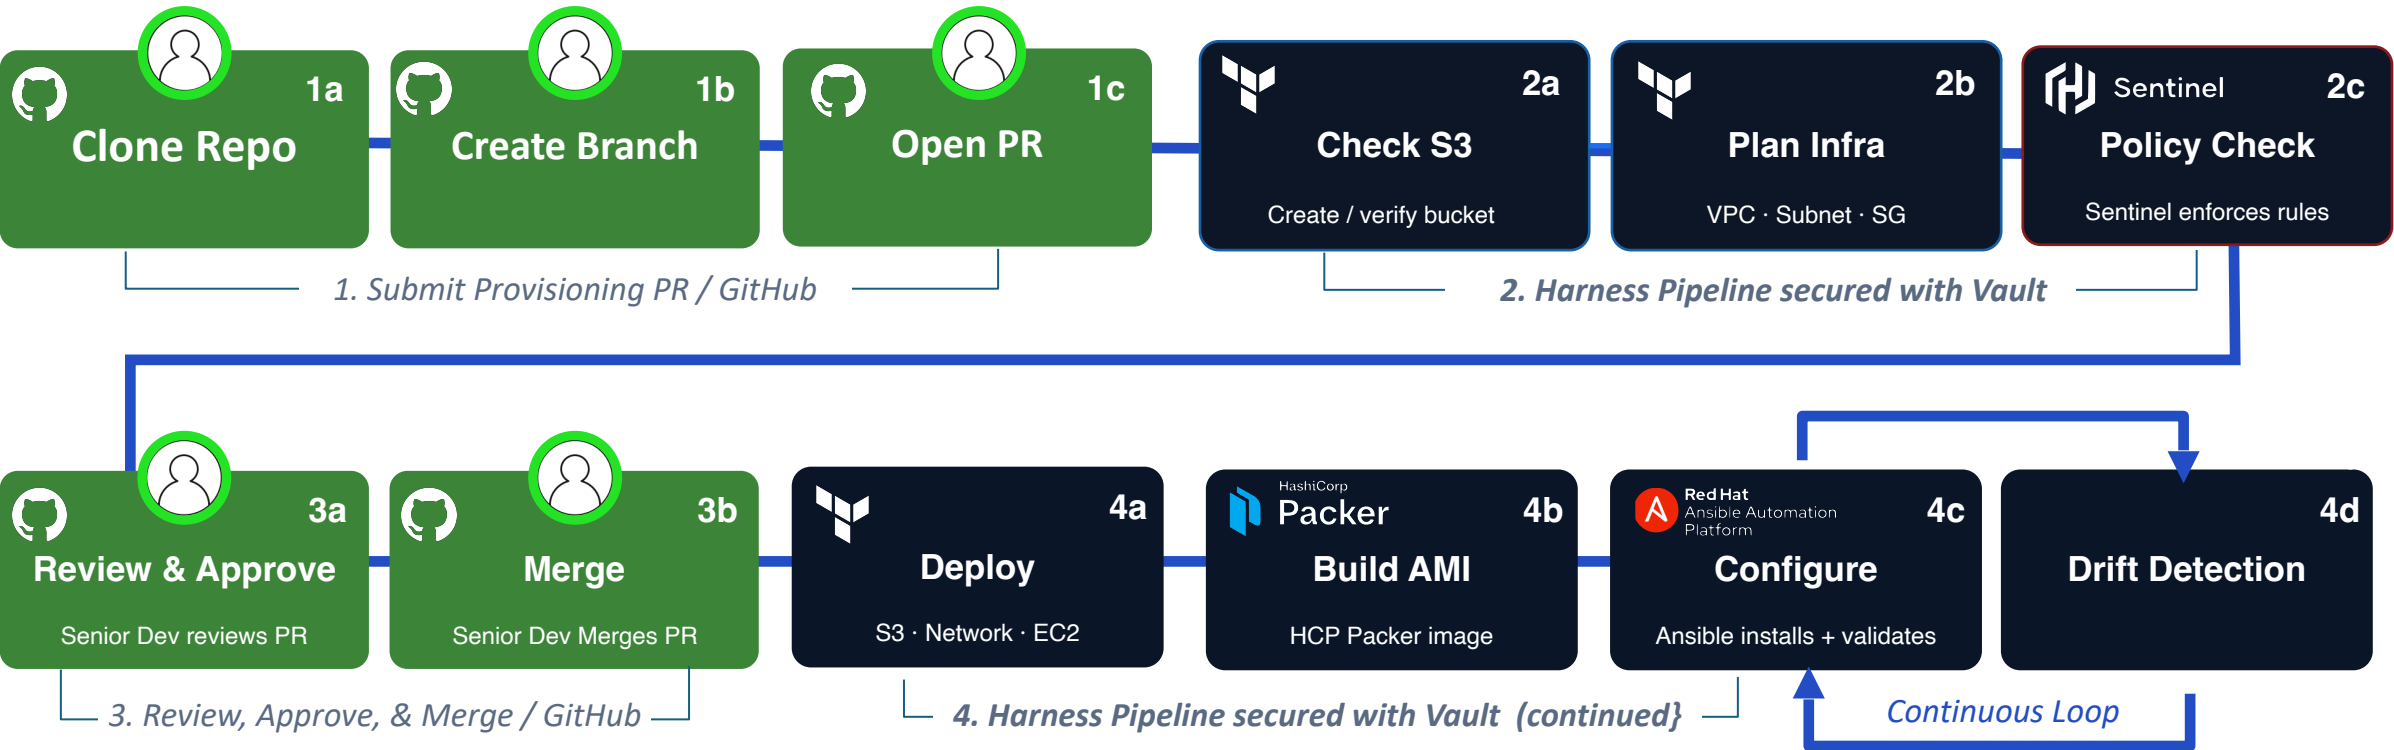

Meet Devin the Developer

"I don't want to become a Terraform expert. I want to declare what I need and trust that the guardrails stop me from doing something wrong."

Pain Points of Today

- 2–3 day wait on platform tickets to provision anything
- Policy failures only surface after deploy, it usually too late
- Config drift: servers get changed manually, no one knows

Self-Service Dev. Experience with Pipeline Stages

Building on and optimizing your existing technology stack

Harness + Sentinel

POLICY ENFORCEMENT

Policy-as-code. Enforces S3 encryption, required tagging, instance type guardrails. Hard-mandatory rules block non-compliant infra.

Terraform Cloud

INFRASTRUCTURE PLAN

Remote plan & apply. State management, audit trail, workspace isolation, and VCS-driven workflow.

HCP Packer

GOLDEN IMAGE BUILD

Hardened Amazon Linux 2023 AMI. Versioned and published to HCP consistent, secure baseline across all instances.

Ansible (AAP)

CONFIGURATION & BASELINE

Post-provision configuration via Red Hat AAP. Installs packages, spins up web server, validates state.

Ansible Automation

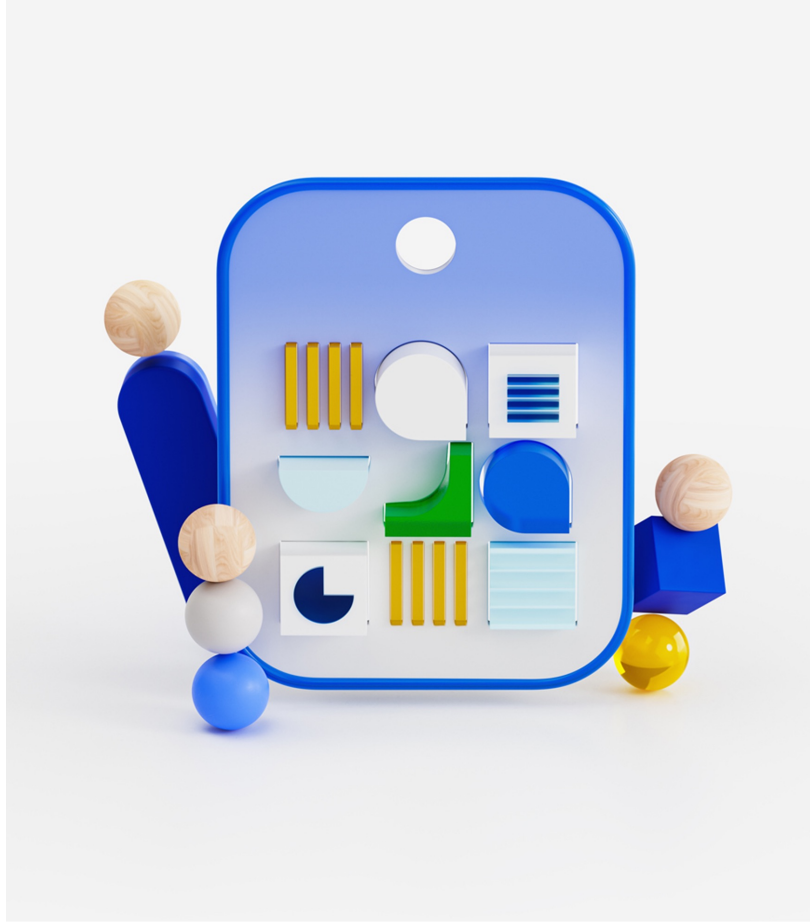

DRIFT DETECTION

Continuously compares live state to baseline. Detects drift and auto-remediates, no human intervention required.

Cloudbility

COST VISIBILITY (FINOPS)

Tag-based cost allocation by business unit. Experian already uses this platform, the workflow extends it automatically.

Business Value

One system. One workflow. Everything else is automatic.

- Infrastructure ships same day, no ticket queues
- Compliance enforced pre-provisioning, never retrofitted
- Drift auto-corrected, systems continuously self-heal
- Hardened golden images only, no snowflake servers
- Cost tags propagate automatically, visible in Cloudability
- Every plan, approval, and policy check lives in the PR, audit-ready by default
- Same workflow scales across all resource types
